Who is Better?

In this world there are many mysteries. Some of these are in the oceans and others in outer space. However, we know more about space than oceans. So which will be better of the two. Which has more interesting things.

Astronomy is the science that studies space exterior. On the other hand, marine biology is the science that studies the living beings of the seas. These two sciences are nowhere to be seen. However, both have only one thing in common, both have many mysteries. NOAA is the government organization that is in charge of studying all the changes that occur in the seas and oceans. However NASA is the organization that is responsible for studying outer space. Obviously both organizations have to receive money from the government to be able to carry out their operations. Currently, the one who receives the most money is NASA. So what do we know about the outer space? We know about a planet called Mars which they are studying to find out if there could be life on that planet. Many astronauts want to come to that planet to be able to investigate about it. It sounds very interesting to do this kind of thing. Finally, I prefer the study of space because it sounds interesting, but we cannot forget our oceans.
